

Policy-based governance for Microsoft 365, Copilot, AI agents and Power Platform, across multiple tenants.

Why partner with Rencore?

Rencore is a governance platform covering Microsoft 365, Copilot, AI agents and Power Platform from one console. It monitors multiple client tenants and enforces policies automatically, so governance can be delivered as a managed service. It is developed in Germany and built in the EU, which suits clients with data sovereignty requirements.

Challenges Rencore solves

Copilot and AI agents inherit existing user permissions, so oversharing and unclear agent ownership turn into security and cost risks. Rencore, however, gives partners control over both, mapping the data and resources AI can access, flagging oversharing and permission risks early, tracking agent ownership and associated costs and applying governance before and during AI rollout.

Opportunities for channel partners

Rencore provides MSPs and IT service providers the opportunity to add a recurring AI governance service across their client base. Automated controls, reporting and remediation reduce the effort needed per tenant and give clients measurable results.

Key features

- Single inventory of Copilot and AI agents with named owners
- Ongoing monitoring of data access, permissions and oversharing
- Automated policy enforcement with prioritised violations
- Audit trails to support compliance and internal controls
- Agent lifecycle management from deployment to retirement
- Visibility of Copilot and AI usage and spend
- Multi-tenant management for delivery as a managed service

Optional add-ons

- Files & Folders: file-level inventory and permissions for SharePoint and OneDrive, plus storage analysis
- Apps, Automation & BI: central inventory and governance for Power Apps, Power Automate and Power BI
